2025

coffeeBreak.

Abstract: coffeeBreak is a modular, plugin-based event management system that offers a customizable and affordable alternative to proprietary tools. It allows organizers to manage schedules, send real-time notifications, and centralize event information. Its flexible architecture enables easy feature extension without altering the core system.

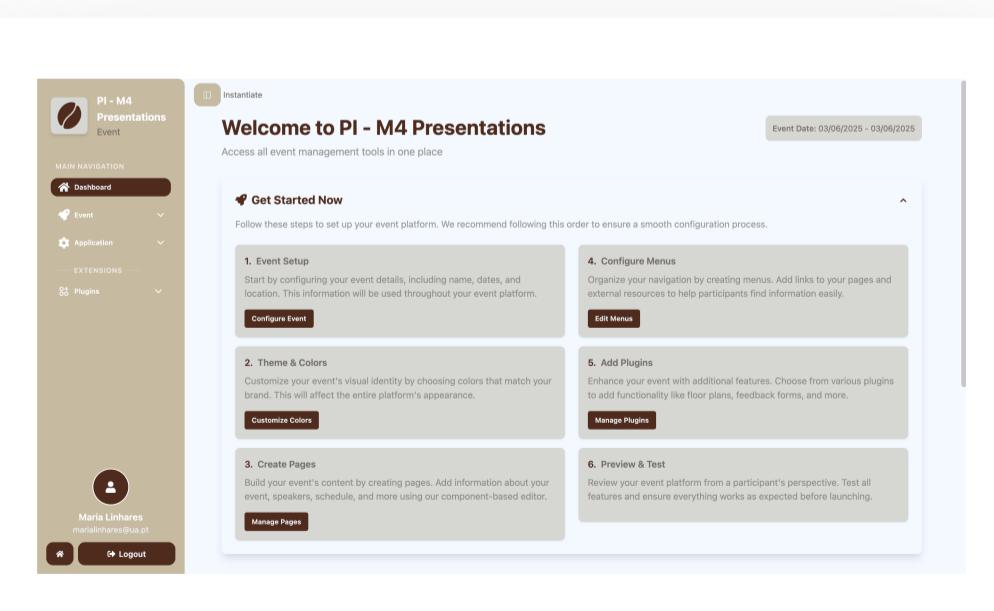

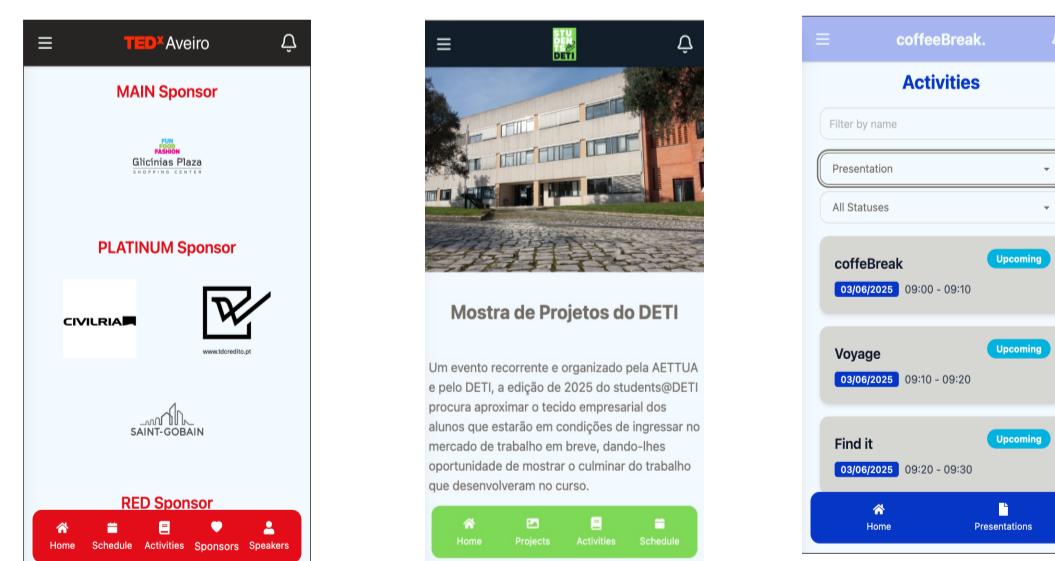

Project Overview

Results

Result 1: coffeeBreak was deployed in three distinct contexts. At TEDxAveiro, an event with almost 400 attendees, the platform was used to deliver real-time alerts and provide centralized access to event information, demonstrating its effectiveness and adaptability.

Result 2: coffeeBreak includes an Admin Dashboard that allows organizers to fully configure their event. This includes customizing visual elements, setting up all required event pages, and managing plugin behavior and content to fit specific needs.

Conclusion: coffeeBreak is a flexible, modular solution that adapts to a wide range of event needs. Its plugin-based design simplifies customization and future feature expansion. Next steps include improving user experience and increasing adoption across more contexts.
